

Wireless-B Broadband Router

User's Manual

Version 1.0

Trademarks

Microsoft, Windows, and Windows NT are registered trademarks of Microsoft Corporation. Other brand and product names are registered trademarks or trademarks of their respective holders.

Statement of Conditions

In the interest of improving internal design, operational function, and/or reliability, we reserves the right to make changes to the products described in this document without notice. We does not assume any liability that may occur due to the use or application of the product(s) or circuit layout(s) described herein.

Federal Communications Commission (FCC) Compliance Notice: Radio Frequency Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

FCC Caution

1. FCC RF Radiation Exposure Statement: The equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with a minimum distance of 20 centimeters between the radiator and your body.
2. This Transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.
3. Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user authority to operate the equipment.

EN 55 022 Declaration of Conformance

This is to certify that the Router is shielded against the generation of radio interference in accordance with the application of Council Directive 89/336/EEC, Article 4a. Conformity is declared by the application of EN 55 022 Class B (CISPR 22). Compliance with the applicable regulations is dependent upon the use of shielded cables. It is the responsibility of the user to procure the appropriate cables.

About This User Manual

Welcome to the Networking world of the Wireless Router!

This manual is intended as a basic introduction to your Wireless Router. It provides enough information to make the Router operational in most common environments: connecting to the Internet, create your own private network and share an Internet connection.

We'll describe how to use your web browser to configure the Router and to perform some basic operations, e.g. upgrading the software, or viewing the connection log, a task which may be useful in ongoing operations. Finally, we'll tell you how to obtain information and help for subjects that are beyond the scope of this manual.

This manual consists of four chapters and two appendixes

Chapter One: Introduction, explains the features and capabilities of the Router.

Chapter Two: Connecting the Router, gives the simple steps for you to follow to connect the Router with PCs and modem.

Chapter Three: Configuring the PCs, describes how to configure each of your PCs to be able to communicate with the Router.

Chapter Four: Configuring the Router, explains how to login to user interface, describes the browser screen, and provides the needed steps to configure your Router for specific applications. It provides easy-to-follow instructions for quick Internet access and provides guidelines to the most popular Router configurations.

Chapter Five: Wireless Configuration, describes how to configure the wireless features of your Router

Chapter Six: Advanced Configuration, provides information on advanced configurations.

Appendix A: Troubleshooting

Appendix B: Specifications

Safety Warnings

The Router is not intended to be serviced by the user. Do not open the case

Chapter 1: Introduction

Overview of the 802.11b Wireless Router

Wireless-B Broadband Router is the perfect solution for connecting multiple computers to a high-speed Broadband Internet connection. This router is combined with a 4-port 10/100 Mbps switch for connection to create a home or small office network, an access point for wireless network, one 10/100 Mbps Ethernet WAN port for a DSL/Cable modem, and an Internet firewall for security against Internet hackers.

The Router has built-in 4-port auto-MDI/MDIX 10/100 Mbps switch, this cutting-edge combination of router and switch technology eliminates the need to buy an additional hub or switch and serves your network as a completely dedicated, full duplex backbone. Built-in a wireless access point, the Router provides a maximum data rate of 11 Mbps, with 64-bit/128-bit WEP Encryption and MAC address filtering for wireless LAN security. It provides you an easy, wireless way to connect multiple computers in your house or office. You can enjoy the freedom of wireless LAN from anywhere in and around the building.

The Router provides a 10/100 Mbps Ethernet WAN port as well as Network Address Translation (NAT) function, which provides the ability to share a DSL or Cable Modem through either its four Ethernet ports or via its integrated wireless access point. It employs a Dynamic Host Configuration Protocol (DHCP) that provides dynamic allocation of IP addresses for up to 253 clients on your network. Designed with MIPS based processor, the Router is an incredibly faster router with more than 60 Mbps LAN to WAN throughput. Being independent of platform, the Router is an ideal networking solution for PC or Mac users.

Wireless Router Features

The Router provides the following features:

- All-in-one networking solution provides wireless access point, IP sharing, switching, and firewall security.
- MIPS based processor provides incredibly performance power for wireless AP and Router.
- Built-in wireless access point connects multiple 802.11b-equipped computers without wires and provides seamless roaming within the IEEE 802.11b WLAN infrastructure.
- More than 60Mbps LAN to WAN throughput eliminates bottleneck of Internet access.
- Auto-MDI/MDIX feature on WAN and LAN ports detect and correct cable error.
- 10/100Mbps Ethernet WAN port connects DSL/Cable modem for high speed Internet sharing access.
- 4-port auto-negotiation 10/100Mbps switch connects multiple computers or another Ethernet network.
- Universal Plug and Play provides easy setup.
- Built-in NAT function allows multiple PCs (up to 253 users) and devices to share one Internet connection.
- Built-in NAT function provides firewall protection against outside intruders.
- 60-bit/128-bit WEP encryption and MAC address filtering provide wireless security.
- High compatibility design and smart set-up wizard ensure easy installation.
- L2TP, PPTP, IPSec Pass Through VPN allows server-client secure connection.
- Virtual Server/DMZ allows multimedia applications and Internet servers on LAN.
- MAC address and IP packet filtering enhance transmission security.
- MAC clone meets specific ISP's requirement for Internet sharing.
- Smart Web-based setup wizard provides easy installation.
- Platform-independent ensures full compatibility with PC or Mac.

The Router's Front Panel

The front panel of the Router contains the status LEDs described below.

System LED Indicators:

Power *Green.* This LED lights up when the Router is powered on.

WLAN LED Indicators:

WLAN *Green.* When the LED lights up, the wireless network is active.

WAN LED Indicators:

WAN *Green.* The LED lights up when WAN port is connected to a device.

LAN LED Indicators:

LAN1~4 *Green.* The LED lights up when the corresponding port is connected to a device.

The Router's Rear Panel

The rear panel of the Router contains the port connections listed below.

Viewed from left to right, the rear panel contains the following features:

- DC power connector for connecting through an AC power adapter (included as part of the product) to the wall power outlet
- Four local (LAN) 10/100 Ethernet ports for connecting the Router to the local PCs or hub, switch
- Ethernet WAN port for connecting the Router to a Cable or DSL modem
- Factory Default Reset push button
- Wireless antenna

The Hardware Reset Button

The Reset button can be used in one of two ways:

1. Reboot the Router while keeping all of its settings.

If the Router is having problems connecting to the Internet, press the **Reset** button for just a moment with a paper clip or a pencil tip. This clears up any jammed connections.

2. Restore the Router's factory defaults and clear all of its settings, including a new password or wireless settings.

If you are experiencing extreme problems with the Router and have tried all other troubleshooting measures, press the **Reset** button and hold it down for 10 seconds.

Chapter 2: Connecting the Router

This chapter describes how to connect the Router to your local area network (LAN). You will have to configure your networked PCs to accept the IP addresses that the Router assigns them, and you will also have to configure the Router with settings provided by your Internet Service Provider (ISP).

The installation technician from your ISP should have left the setup information for your modem with you after installing your broadband connection. If not, you can call your ISP to request that data. Once you have the setup information you need for your broadband connection, you can begin installation and setup the Router.

If you want to use a PC with an Ethernet adapter to configure the Router, go to “Connecting wired PC to the Router”. If you want to use a PC with a wireless adapter to configure the Router, go to “Connecting wireless PC to the Router”.

What you need to do before you begin

Before connecting the Router, it's highly recommended to connect your PC to the modem directly, and make sure you can get on the Internet without problem.

Connecting wired PC to the Router

Follow these steps to connect wired PC to the Router.

1. Power on the Router and modem, and make sure all of your PCs are powered off.

2. Connect one end of an Ethernet cable to one of the LAN ports on the rear of the Router, and the other end to an Ethernet port on a PC. (Repeat this step to connect more PCs, a switch, or other network devices to the Router)

3. Connect a different Ethernet cable from your Cable or DSL modem to the WAN port on the rear of the Router.

4. Power on all of your PCs. If all of your Link LEDs are not lighting up, make sure that all your cables are securely plugged in, and that all of your hardware is powered on properly.

Connecting wireless PC to the Router

Follow these steps to connect wireless PC to the Router.

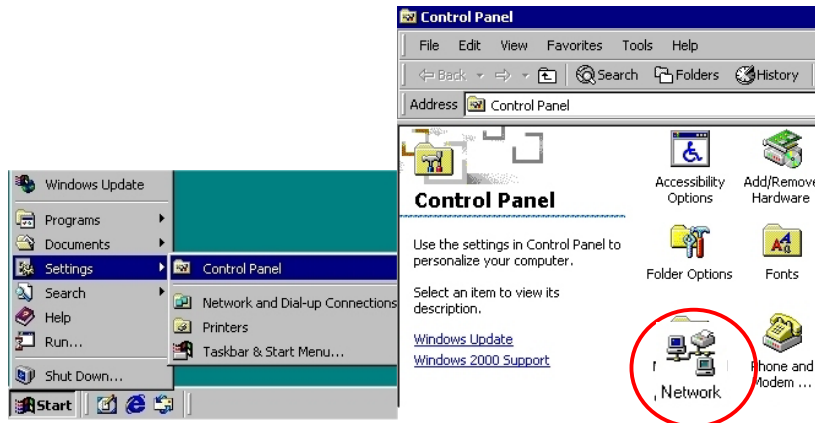

1. Power on the Router and modem, and make sure all of your PCs are powered off.
2. Connect an Ethernet cable from your Cable or DSL modem to the EWAN port on the rear of the Router.
3. Power on all of your PCs on the wireless network.
4. For initial access to the Router through a wireless connection, make sure the PC's wireless adapter has its SSID set to WLAN (the Router's default setting), and its WEP encryption is disabled. After you have accessed the Router, you can change the Router and this PC's adapter settings to match your usual network settings.

Chapter 3: Configuring the PCs

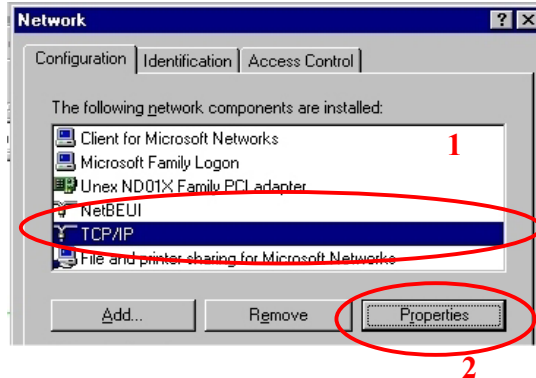

This chapter describes how to configure each of your PCs to be able to communicate with the Router. To do this, you need to configure your PC's network settings to obtain an IP address automatically, so your PC can function as a DHCP client.

Configuring Windows 98 and Windows Me PCs

1. Click the **Start** button, select **Settings** and then **Control Panel**. Double-click the **Network** icon.

2. On the Configuration tab, select the **TCP/IP** line for the applicable Ethernet adapter. Do not choose a TCP/IP entry whose name mentions PPPoE, VPN..etc. If the word TCP/IP appears by itself, select that line. Click the **Properties** button.

3. Click the **IP Address** tab, select **Obtain an IP address automatically**.

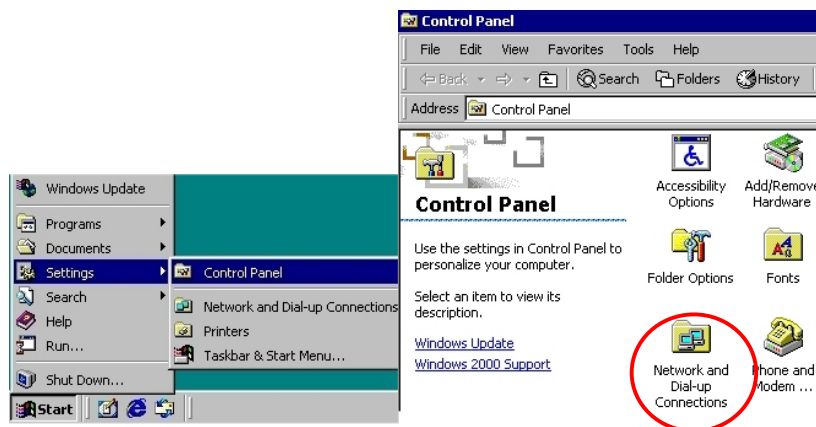

4. Click the **Gateway** tab, and verify that the **Installed Gateway** field is blank. Click the **OK** button.
5. Click the **OK** button again. Windows may ask you for the original Windows installation CD or additional files. Check for the files at c:\windows\options\cabs, or insert your Windows CD-ROM into your CD-ROM drive and check the correct file location, e.g., D:\win98 (if “D” is the letter of your CD-ROM drive).
6. Windows may ask you to restart your PC. Click the **Yes** button. If Windows does not ask you to restart, restart your PC anyway.

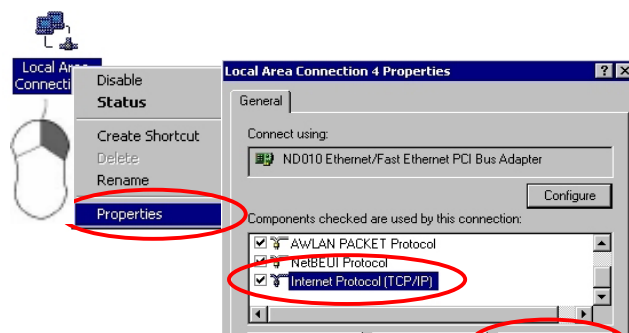

Go to “Chapter 4: Configuring the Router”

Configuring Windows 2000 PCs

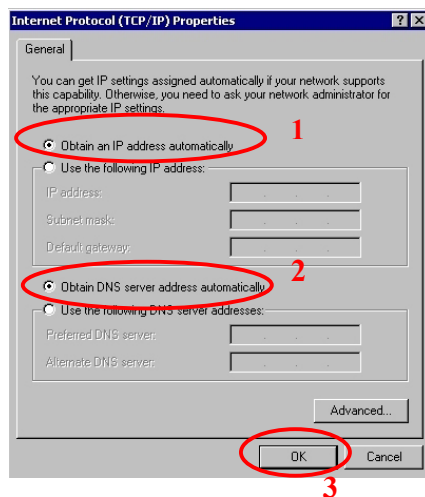

1. Click the **Start** button, select **Settings** and then **Control Panel**. Double-click the **Network and Dial-up Connections** icon.

2. Select the **LAN Area Connection** icon for the applicable Ethernet adapter. Right-click the icon, then click the **Properties** option.
3. Make sure the box next to **Internet Protocol (TCP/IP)** is checked. Highlight **Internet Protocol (TCP/IP)**, and click the **Properties** button.

4. Select **Obtain an IP address automatically** and **Obtain DNS server address automatically**. Once the new window appears, click the **OK** button. Click the **OK** button again to complete the PC configuration.

5. Restart your PC.

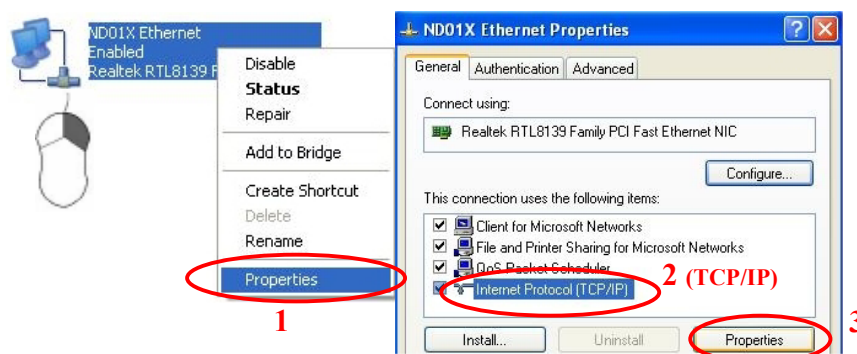

Go to “Chapter 4: Configuring the Router”

Configuring Windows XP PCs

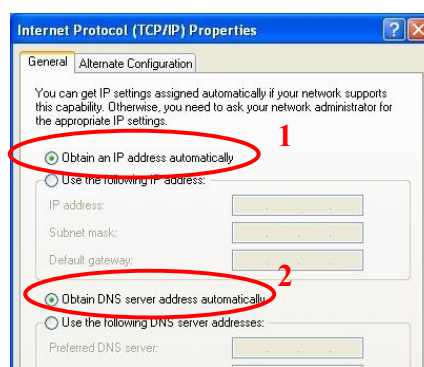

1. Click the **Start** button, select **Settings** and then **Control Panel**. Double-click the **Network Connections** icon.

2. Select the **Local Area Connection** icon for the applicable Ethernet adapter. Right-click the **Local Area Connection**, then click the **Properties** option.
3. Make sure the box next to **Internet Protocol (TCP/IP)** is checked. Highlight **Internet Protocol (TCP/IP)**, and click the **Properties** button.

4. Select **Obtain an IP address automatically** and **Obtain DNS server address automatically**. Once the new window appears, click the **OK** button. Click the **OK** button again to complete the PC configuration.

Go to “Chapter 4: Configuring the Router”

Chapter 4: Configuring the Router

Once you have completed all the hardware installation and have configured your PCs properly as described in chapter three, you are ready to configure the Router for actual applications. The instructions from your ISP tell you how to set up your PC for Internet access. Because you are now using the Router to share Internet access among several PCs, you will use the setup information to configure the Router instead of your PC. You only need to configure the Router one time by using one of the PC you set up.

Using the Setup Wizard

The Setup Wizard will guide you step by step to configure the Router.

1. Connect to the Router by typing **http://192.168.62.1** in the address field of Internet Explorer or Netscape Navigator.

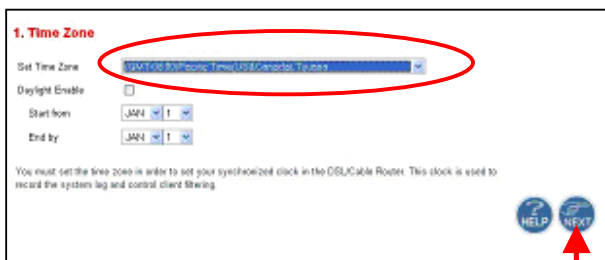

2. A setup screen will appear. Click **Setup Wizard**.

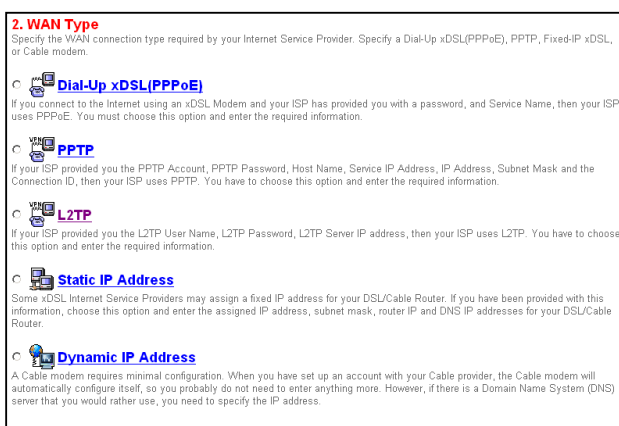

3. For security reason, the Router has its own user name and password. When prompted, enter **admin** for the user name and **1234** for the password. Click **OK** button.

4. Select the time zone for your location. If your location experiences daylight saving, check the box next to *Daylight Saving*. Click **NEXT** button.

5. Based on the setup instructions from your ISP, you need to select one of WAN connection types. The Router supports five connection types: PPPoE, PPTP, L2TP, Static IP Address, and Dynamic IP Address. Each setup screen and available features will differ depending on what kind of connection type you select.

PPPoE

If your DSL provider says that you are connecting through PPPoE, perform these steps:

- Enter the User Name
- Enter the Password
- Reenter the password
- Enter the Service Name if your ISP requires it. This is optional.
- Keep the value of MTU as default setting.
Note: MTU (**M**aximum **T**ransmission **U**nit) is the largest frame size that can be transmitted over the network. Messages longer than the MTU must be divided into smaller frames.

- To change the maximum idle time, enter a new value in minutes. This determines how long the Router keeps the Internet connection active after there is no Internet activity from the LAN. Enter a value of zero means never log out.
- By checking the box next to **Auto-reconnect**, the Router will automatically connect to Internet if you are disconnected.

Important: If you enable PPPoE, remember to remove any PPPoE applications already installed on any of your PCs.

3. WAN Settings

 **PPPoE**

| | |
|-----------------------------|--|
| User Name | <input type="text"/> |
| Password | <input type="password"/> |
| Please retype your password | <input type="password"/> |
| Service Name | <input type="text"/> |
| MTU (1400-1492) | <input type="text" value="1492"/> |
| Maximum Idle Time | <input type="text" value="0"/> (minutes) <input type="checkbox"/> Auto-reconnect |

PPTP

Point to Point Tunneling Protocol (PPTP) is a service that applies to connections in Europe only.

If your DSL provider says that you are connecting through PPTP, perform these steps:

- Enter the PPTP Account
- Enter the PPTP Password
- Reenter the PPTP Password
- Enter the Host Name if your ISP requires it.
- Enter Service IP Address. Your ISP will provide you with the Service IP Address.
- Enter My IP Address. This is the Router's IP address, when seen from the Internet. Your ISP will provide you with the IP Address you need to specify here.
- Enter My Subnet Mask. This is the Router's subnet mask, as seen by external users on the Internet. Your ISP will provide you with the subnet mask.
- Enter the Connection ID if your ISP requires it, or leave it blank.
- Keep the value of MTU as default setting.
Note: MTU (**M**aximum **T**ransmission **U**nit) is the largest frame size that can be transmitted over the network. Messages longer than the MTU must be divided into smaller frames.
- To change the maximum idle time, enter a new value in minutes. This determines how long the Router

3. WAN Settings

 **PPTP**

| | |
|-----------------------------|--|
| PPTP Account | <input type="text"/> |
| PPTP Password | <input type="password"/> |
| Please retype your password | <input type="password"/> |
| Host Name | <input type="text"/> |
| Service IP Address | <input type="text" value="0.0.0.0"/> |
| My IP Address | <input type="text" value="0.0.0.0"/> |
| My Subnet Mask | <input type="text" value="0.0.0.0"/> |
| Connection ID | <input type="text" value="0"/> (Optional) |
| MTU (1400-1460) | <input type="text" value="1460"/> |
| Maximum Idle Time | <input type="text" value="0"/> minutes <input type="checkbox"/> Auto-reconnect |

keeps the Internet connection active after there is no Internet activity from the LAN. Enter a value of zero means never log out.

- k. By checking the box next to **Auto-reconnect**, the Router will automatically connect to Internet if you are disconnected.

Important: If you enable PPTP, remember to remove any PPTP applications already installed on any of your PCs.

L2TP

Select this option when your ISP uses L2TP. Choose “Obtain an L2TP Server IP address automatically” if your ISP supports it, or choose “Use the following L2TP Server IP address” and fill in the L2TP Server IP address. Then, enter the L2TP User Name and Password assigned by your ISP. Enter a Maximum Idle Time (in minutes) to define a maximum period of time for which the Internet connection is maintained during inactivity. If the connection is inactive for longer than the defined Maximum Idle Time, then connection will be dropped. You can enable the Auto-reconnect option to automatically re-establish the connection as soon as you attempt to access the Internet again.

Static IP Address

If you are required to use a permanent IP address to connect to the Internet, then select **Static IP Address**.

- a. Enter the IP address assigned by your ISP. This is the Router’s IP address, when seen from the Internet. Your ISP will provide you with the IP address you need to specify here.
- b. Enter Subnet Mask. This is the Router’s subnet mask, as seen by external users on the Internet. Your ISP will provide you with the subnet mask.
- c. Enter ISP Router Address. Your ISP will provide you with the IP address you need to specify here. This is the ISP server’s IP address.

Dynamic IP Address

If your ISP supports DHCP or you are connecting through a dynamic IP address, then select **Dynamic IP Address**.

- a. Enter the Host Name if your ISP requires it, or leave it blank.
- b. Enter the MAC Address and click **Clone MAC Address** button if your ISP requires a specific MAC address, or keep it default setting.

Important: Some ISPs may require a specific MAC address in order to establish Internet connection.

Click **APPLY** button when completing the selected WAN Setting.

6. If your ISP will automatically assign DNS IP addresses to the Router, keep the default setting here, then click **NEXT** button.
If your ISP does not automatically assign DNS IP addresses to the Router (e.g., when **Static IP Address** connection type is selected), enter the DNS IP address in the field of *Primary DNS address* and *Secondary DNS address*. You need to enter at least primary DNS address. Click **FINISH** button to complete setup wizard.

4. DNS

A Domain Name system (DNS) server is like an index of IP addresses and Web addresses. If you type a Web address into your browser, such as www.abcd.com, a DNS server will find that name in its index and find the matching IP address. 161.50.165.122.

Most ISPs provide a DNS server for speed and convenience. Since your Service Provider may connect to the Internet with dynamic IP settings, it is likely that the DNS server IP addresses are also provided dynamically. However, if there is a DNS server that you would rather use, you need to specify the IP address below.

Primary DNS address:

Secondary DNS address:

Enter DNS address, or keep it zero for dynamic assignment by ISP

[BACK](#) [HELP](#) [FINISH](#)

Chapter 5: Wireless Configuration

This chapter describes how to configure the wireless features of your Router. In planning your wireless network, you should consider the level of security required. You should also select the appropriate placement of your Router in order to maximize the wireless performance.

Guidelines to locate your Router

The operating distance or range of your wireless connection can vary significantly based on the physical placement of the Router. For best performance, place your Router:

- Near the center of the area in which your PCs will operate.
- Away from sources of interference, such as PCs, microwaves, and 2.4GHz cordless phones.
- Away from large metal surfaces.

Understanding the wireless security

Unlike wired network data, your wireless data transmissions can be received well beyond your walls by anyone with a compatible adapter. For this reason, use the security features of your wireless devices. The Router provides effective security features which are covered in detail in this chapter.

There are several ways you can implement the security of your wireless network.

- **Restrict access based on MAC address.** The wireless MAC filters feature allows you to control which wireless-equipped PCs may or may not communicate with the Router depending on their MAC addresses. MAC address filtering adds an obstacle against unwanted access to your network, but the data broadcast over the wireless link is fully exposed.
- **WEP.** Wired Equivalent Privacy (WEP) is an encryption method used to protect your wireless data communications. WEP uses 64-bit or 128-bit keys to provide access control to your network and encryption security for every data transmission. To decode data transmissions, all wireless devices must use an identical WEP key. Higher encryption levels offer higher levels of security, but due to the complexity of the encryption, they may decrease network performance.

Understanding the wireless settings

To configure the wireless setting of the Router, click “**Advanced Setup**”, key-in user name and password, click “**LAN**” then “**Wireless**” link in the menu of the browser interface. The wireless settings menu will appear, as shown below.

☒ Radio Setting
 ☐ Security Setting
 ☐ Status

Wireless: ☒ **Enable Wireless** ☐ **Disable Wireless**

FirmWare Version: 1.3.8

ESSID:

Channel:

Beacon Interval: msec

RTS Threshold: (256-2432)

Fragmentation Threshold: (256-2346, even numbers only)

DTIM Interval: (1-65535)

Max Stations: (1-254)

Basic Rates: ☐ 1-2Mbps ☒ 1-2-5.5-11Mbps

TX Rates: ☐ 1-2Mbps ☒ 1-2-5.5-11Mbps

Preamble Type: ☐ Short Preamble ☒ Long Preamble

- **Enable Wireless.** If you disable the wireless, wireless devices cannot connect to the Router.
- **ESSID.** The Extended Service Set Identifier (ESSID) is the network name shared among all devices in a wireless network. The ESSID must be identical for all devices in the wireless network. It is case-sensitive and must not exceed 32 alphanumeric characters, which may be any keyboard character. Make sure this setting is the same for all devices in your wireless network.
- **Channel.** This field determines which operating frequency will be used. It should not be necessary to change the wireless channel unless you notice interference problems with another nearby access point or wireless router.
- **Beacon Interval.** The default value is 100. Enter a value between 1 and 65,535 milliseconds. The Beacon Interval value indicates the frequency interval of the beacon. A beacon is a packet broadcast by the Router to synchronize the wireless network.
- **RTS Threshold.** This value should remain at its default setting of 2432. The range is 256 ~ 2432 bytes. Should you encounter inconsistent data flow, only minor modifications are recommended. If a network packet is smaller than the present RTS threshold size, the RTS/CTS mechanism will not be enabled. The Router sends Request to Send (RTS) frames to a particular receiving station and negotiates the sending of a data frame. After receiving an RTS, the wireless station responds with a Clear to Send (CTS) frame to acknowledge the right to begin transmission.
- **Fragmentation Threshold.** This value should remain at its default setting of 2346. The range is 256 ~ 2346 bytes. It specifies the maximum size for a packet before data is fragmented into multiple packets. If you experience a high packet error rate, you may slightly increase the Fragmentation Threshold. Setting the Fragmentation Threshold too many may result in poor network performance. Only minor modifications of this value are recommended.
- **DTIM Interval.** The default value is 1. This value, between 1 and 65,535 milliseconds, indicates the interval of the Delivery Traffic Indication Message (DTIM). A DTIM field is a countdown field

informing clients of the next window for listening to broadcast and multicast messages. When the Router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. Its clients hear the beacons and awaken to receive the broadcast and multicast messages.

- **Max Stations.** The default value is 250. This value, between 1 and 254, represents the maximum number of wireless clients, which are allowed to connect with the Router.
- **Basic Rates.** Shows the set of rates reported as Basic Rates.
- **TX Rates.** Shows the set of Transmission Rates.
- **Preamble Type.** The preamble defines the length of the CRC block for communication between the Router and a wireless network adapter. (High network traffic areas should use the short preamble type.) In most cases, keep default setting as Long Preamble.

☐ Radio Setting **Security Setting** ☐ Status

Authentication Type: ☐ Open System ☐ Shared Key ☒ **Both**

Encryption: ☐ Enable ☒ **Disable**

Wireless Access Control: ☐ On ☒ **Off**

Enhanced Security: ☒ **Hide SSID in Beacon frame and Block response to "Unspecified SSID"**

- **Authentication Type.** The default is set to **Both**, which allows either Open System or Shared Key authentication to be used. For Open System authentication, the sender and the recipient do not use a WEP key for authentication. For Shared Key authentication, the sender and recipient use a WEP key for authentication.

☐ Radio Setting **Security**

Authentication Type: ☐ Open System ☐ Shared Key

Encryption: ☒ **Enable** ☐ Disable

Wireless Access Control: ☐ On ☒ **Off**

Enhanced Security: ☐ Hide SSID in Beacon frame ar

To create new WEP keys, enter a passphrase and click **Generate**. Or, you can manually enter the key elements into the table below.

Encryption Level: ☒ **64 Bit** ☐ 128 Bit

WEP Key Type: ☒ **Automatic** ☐ Manually
☒ Alphanumeric: 5 characters
☐ Hexadecimal: 10 digits(0-9, A-F)

Passphrase:

Key 1: Key 2:
 Key 3: Key 4:

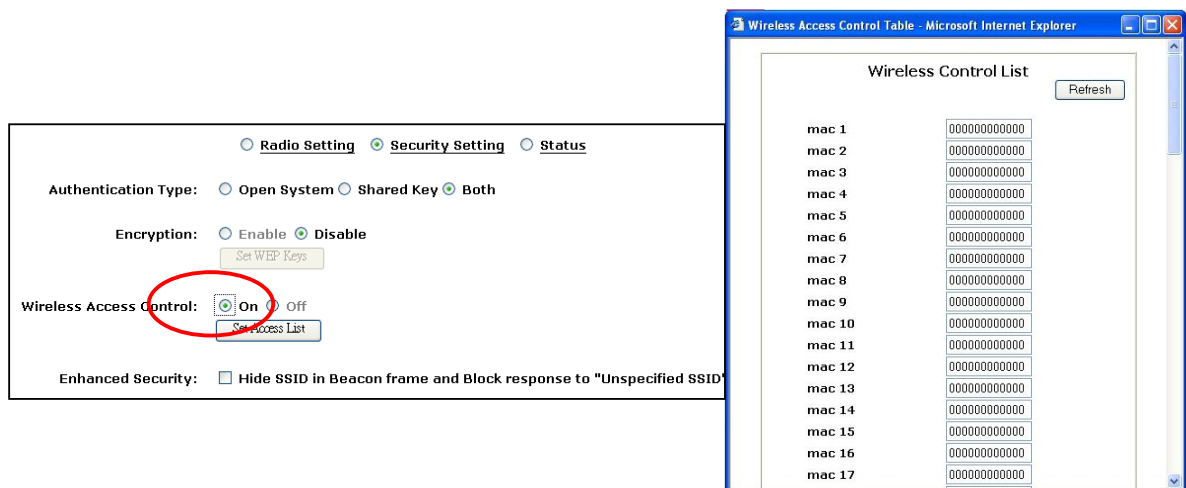

Default TX Key: 1

- **Encryption.** The default setting is Disable, which means no encryption will be applied. If WEP is enabled, you can manually or automatically program the encryption keys. These values must be identical on all wireless devices in your wireless network.

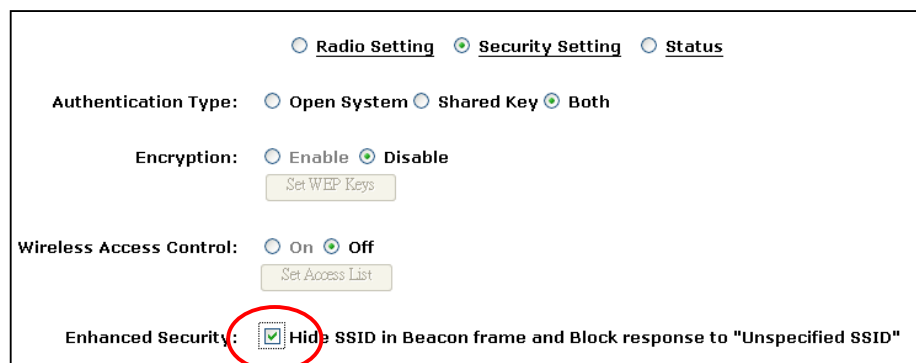

There are two levels of WEP encryption, 64-bit and 128-bit. Higher encryption level offers higher level of security, but due to the complexity of the encryption, they may decrease network performance.

There are two methods for creating WEP encryption keys:

- **Automatically.** Enter a word or group of printable characters in the Passphrase box and click the Generate button. These characters are case sensitive.
- **Manually.** There are two different key formats, **Alphanumeric** (also called ASCII) and **Hexadecimal**. For 64-bit WEP, enter 5 characters in Alphanumeric format, or 10 digits (any combination of 0-9, a-f, or A-F) in Hexadecimal format. For 128-bit WEP, enter 13 characters in Alphanumeric format, or 26 digits (any combination of 0-9, a-f, or A-F) in Hexadecimal format.
- **Default TX Key.** Select which WEP Key (1~4) will be used when the Router sends data. Make sure the receiving device is using the same key.

- **Wireless Access Control.** Click on button to set the authorized MAC addresses list. Only the devices on the Wireless Control List will be allowed to wirelessly connect to the Router.

- **Enhanced Security.** Check the box to hide the SSID or block the unspecified SSID. When wireless clients survey the local area for wireless networks to associate with, they will detect the SSID broadcasted by the Router. To broadcast the Router's SSID, keep the default setting. If you do not want to broadcast the Router's SSID, then check the box next to hide the SSID.

Configuring the basic wireless settings

Follow the instructions below to set up and test basic wireless connectivity. Once you have established basic wireless connectivity, you can enable security settings appropriate to your needs.

1. Connect to the Router at its default IP address of **http://192.168.62.1**, or using whatever LAN IP address you have set up.
2. Click **“Advanced Setup”**, then key-in default user name of **“admin”** and default password of **“1234”**, or using whatever password you have set up.
3. Click **“LAN”** in the main menu, and then click **“Wireless”**.
4. Make sure the box next to **“Enable Wireless”** is checked.
5. Choose a suitable description name for the wireless network name (ESSID) or keep it default. In the ESSID box, enter a value of up to 32 alphanumeric characters.
6. Set the Channel or keep it default. The default channel is 6.
7. Keep all other fields in default settings.
8. Click **“APPLY”** button to save your changes.
9. Configure and test your PCs for wireless connectivity. Check the wireless adapter of your PCs to have a wireless link and are able to obtain an IP address by DHCP from the Router.

Once your PCs have basic wireless connectivity to the Router, then you can configure the advanced wireless security functions of the Router.

Configuring WEP

Follow the instructions below to set up WEP data encryption:

Important! If you use a wireless PC to configure WEP settings, you will be disconnected when you click on APPLY. You must then either configure your wireless adapter to match the Router WEP settings or access the Router from a wired PC to make any further changes.

1. Connect to the Router at its default IP address of **http://192.168.62.1**, or using whatever LAN IP address you have set up.
2. Click **“Advanced Setup”**, then key-in default user name of **“admin”** and default password of **“1234”**, or using whatever password you have set up.
3. Click **“LAN”** in the main menu, and then click **“Wireless”**.
4. Click **“Security Setting”**.
5. Check the box next to **“Enable”**, and click **“Set WEP Keys”**.
6. Form the setup screen, select the level of WEP encryption you wish to use, 64 Bit or 128 Bit.
7. You can automatically or manually program the encryption keys. These values must be identical on all PCs and Router.
 - **Automatic:** Enter a word or group of printable characters in the Passphrase box and click the Generate button. These characters are case sensitive.
 - **Manually:** There are two different key formats, **Alphanumeric** (also called ASCII) and **Hexadecimal**. For 64-bit WEP, enter 5 characters in Alphanumeric format, or 10 digits (any combination of 0-9, a-f, or A-F) in Hexadecimal format. For 128-bit WEP, enter 13 characters in Alphanumeric format, or 26 digits (any combination of 0-9, a-f, or A-F) in Hexadecimal format.
 - **Default TX Key:** Select which WEP Key (1~4) will be used when the Router sends data. Make sure the receiving device is using the same key.
8. Click **“Apply”** button to save your settings.

Chapter 6: Advanced Configuration

Advanced Setup

Setup Wizard

The setup wizard will allow you to configure your DSL/Cable Router for use with a DSL or Cable modem. Follow the wizard through each step to set up the DSL/Cable Router.

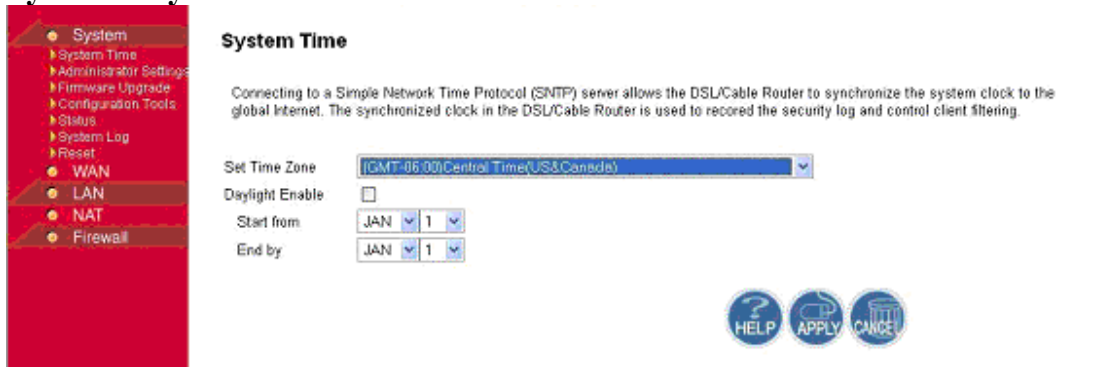

Advanced Setup

The DSL/Cable Router supports advanced functions like hacker attack detection, special application access, a virtual DMZ host, virtual servers, client filtering, and VPN pass-through. Highly recommend you to keep the default settings.

The advanced setup menu is used to configure the LAN and WAN settings, as well as other advanced functions such as resetting the router, restoring to factory default settings, hosting services and upgrading to newer version of firmware, client filtering and special applications. For the instructions below to enter into the Advanced Setup:

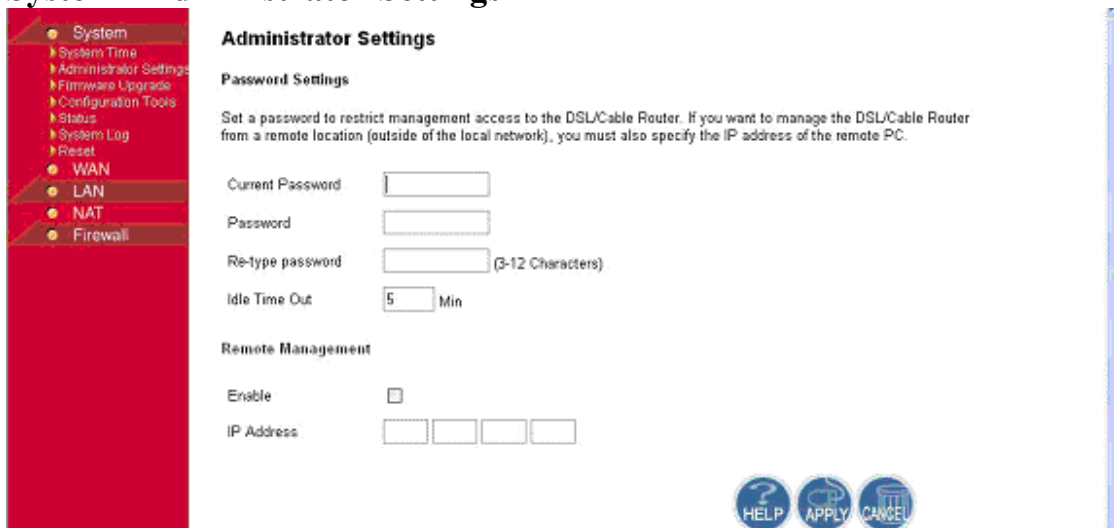

1. Connect to the Router at its default IP address of **http://192.168.62.1**, or using whatever LAN IP address you have set up.
2. Click “**Advanced Setup**”, then key-in default user name of “**admin**” and default password of “**1234**”, or using whatever password you have set up.

System - System Time

Set the time zone for the Router and connecting to a Simple Network Time Protocol (SNTP) server which allows the Router to synchronize the system clock to the global Internet. The synchronized clock in the Router is used to record the security log and control client filtering.

System - Administrator Settings

Use this menu to restrict management access based on a specific password. The default password is **1234**. Passwords can contain from 3-12 alphanumeric characters, and are case sensitive.

Idle Time-out - The amount of time of inactivity before the Router will automatically close the Administrator session.

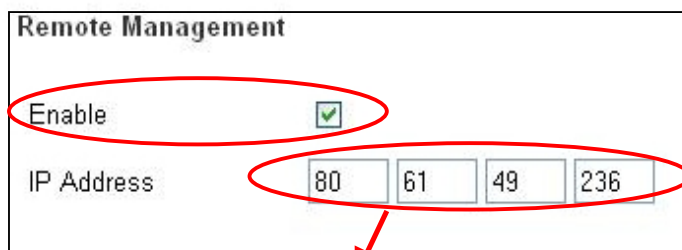

Remote Management – Using the Remote Management feature, you can allow a remote administrator on the Internet to configure, upgrade and check the status of your Router.

To configure your Router for Remote Management:

1. Check the box next to “**Enable**”.
2. Specify the IP address which will be allowed to access the Router.
3. Click “**APPLY**” button to have your settings take effect.

Note:

1. When accessing your Router from the Internet, you will type your Router’s

Specify the IP address of a remote administrator’s PC

WAN IP address into the browser's address of remote administrator, followed by a colon ':' and the custom port number.

For example, if Router's WAN IP address is 210.61.49.227, you must enter ***http://210.61.49.227:8080*** in the browser of remote administrator.

2. To view the Router's WAN IP address, you can check it from the **Status** screen.

System - Firmware Update

The Router software (firmware) is stored in flash memory, and can be upgraded as new firmware is released. Upgrade files can be downloaded from vendor's website. If the file is compressed (.ZIP file), you must first extract the .IMG file before loading to the Router.

Click "**Browse..**" button to load the firmware file then click "**APPLY**" button. You will be prompted to confirm the upgrade.

System - Configuration Tools

Check the box next to "**Restore Factory Default Configuration**" then click "**APPLY**" button to reset all configuration settings to their default values. Any settings you have saved will be lost when the default settings are restored. This feature is disabled by default.

System - Status

Status

You can use the Status screen to see the connection status for the DSL/Cable Router' WAN/LAN interfaces, firmware and hardware version numbers, and the number of connected clients to your network.

Host Name:
Domain:

PPPoE Login: Disabled

PPTP Login: Disabled

LAN:

IP Address: 192.168.62.1
Subnet Mask: 255.255.255.0
Mac Address: 00:10:a7:26:80:c4

WAN: Dynamic

IP Address: 210.61.49.227
Subnet Mask: 255.255.255.0
Default Gateway: 210.61.49.254
DNS: 168.95.1.1
0.0.0.0
0.0.0.0
MAC Address: 00:10:a7:26:80:c5

AP Radio

Status: up
Max. speed: 54 MBps
IP Address: 192.168.62.1
MAC Address: 00:10:a7:26:80:c6
Radio SSID: WLAN

You can use the Status screen to see the connection status for the Router's WAN/LAN interfaces.

System - Security Log

Use the Log screen to set up and view log files that record the access activity of LAN and WAN clients.

Access Log: ☒ **Enable** ☐ **Disable**

You may choose to **Enable** or **Disable** the Log feature. Click **Apply** to put your changes in effect, or click **Cancel** to undo your changes.

Session Event Log

Click **Session Event Log** to launch the Session Event Log Table window. In this screen, you can view session event entries. The **Session Event Log Table** shows **Index number**, **Transport Type**, **Source IP**, **Source Port**, **Destination IP**, **Destination Port**, and **Terminate Reason**.

Click **Refresh** to see the latest data.

Block Event Log

Click **Block Event Log** to launch the Block Event Log Table window. In this screen, you can view blocking event entries. The **Block Event Log Table** shows **Index number**, **Transport Type**, **Source IP**, **Source Port**, **Destination IP**, **Destination Port**, and **Termination Reason**.

Click **Refresh** to see the latest data.

Intrusion Event Log

Click **Intrusion Event Log** to launch the Intrusion Event Log Table window. In this screen, you can view intrusion event entries. The **Intrusion Event Log Table** shows **Index number**, **Record Time**, and **Intrusion Type**.

Click **Refresh** to see the latest data.

Wireless Event Log

Click **Wireless Event Log** to launch the Wireless Event Log Table window. In this screen, you can view wireless event entries. The **Wireless Event Log Table** shows **Index number**, **Time**, **Severity**, and **Description**.

Click **Refresh** to see the latest data.

System - Reset System

Reset DSL/Cable Router

In the event that the DSL/Cable Router stops responding correctly or in some way stops functioning, you can perform a reset. Your settings will not be changed. To perform the reset, click on the "Reset" button below. You will be asked to confirm your decision. The reset will be complete when the power light stops blinking.

Reset

In the event that the Router stops responding correctly or in some way stops functioning, you can perform a reset. Your settings will not be changed. To perform the reset, click on the "**Reset**" button below. You will be asked to confirm your decision. The reset will be complete when the power light stops blinking.

WAN Setting

- System
- WAN
- PPPoE
- PPTP
- Static IP
- Dynamic IP
- DNS
- Dynamic DNS
- Proxy DNS
- LAN
- NAT
- Firewall

WAN

The DSL/Cable Gateway can be connected to your service provider in any of the following ways:

| | |
|---|--|
| <input type="radio"/> PPPoE | PPP over Ethernet is a common connection method used for xDSL. |
| <input type="radio"/> PPTP | PPP Tunneling Protocol can support multi-protocol Virtual Private Networks (VPN). |
| <input type="radio"/> Static IP Address | Uses a static IP address. Your service provider gives a static IP address to access Internet services. |
| <input checked="" type="radio"/> Dynamic IP Address | Obtain an IP address automatically from your service provider. |

WAN - PPPoE

| PPPoE | |
|---|--|
| Enter the PPPoE user name and password assigned by your Service Provider. The Service Name is normally optional, but may be required by some service providers. Enter a Maximum Idle Time (in minutes) to define a maximum period of time for which the Internet connection is maintained during inactivity. If the connection is inactive for longer than the defined Maximum Idle Time, then it will be dropped. You can enable the Auto-reconnect option to automatically re-establish the connection as soon as you attempt to access the Internet again. | |
| If your Internet Service Provider requires the use of PPPoE, enter the information below. | |
| User Name | <input type="text"/> |
| Password | <input type="password"/> |
| Please retype your password | <input type="password"/> |
| Service Name | <input type="text"/> |
| MTU (1400-1492) | <input type="text" value="1492"/> |
| Maximum Idle Time | <input type="text" value="0"/> (minutes) <input type="checkbox"/> Auto-reconnect |

If your DSL provider says that you are connecting through PPPoE, perform these steps:

- a. Enter the User Name
- b. Enter the Password
- c. Reenter the password
- d. Enter the Service Name if your ISP requires it. This is optional.
- e. Keep the value of MTU as default setting.
- f. Note: MTU (**M**aximum **T**ransmission **U**nit) is the largest frame size that can be transmitted over the network. Messages longer than the MTU must be divided into smaller frames.
- g. To change the maximum idle time, enter a new value in minutes. This determines how long the Router keeps the Internet connection active after there is no Internet activity from the LAN. Enter a value of zero means never log out.
- h. By checking the box next to **Auto-reconnect**, the Router will automatically connect to Internet if you are disconnected.

Important: If you enable PPPoE, remember to remove any PPPoE applications already installed on any of your PCs.

WAN - PPTP

PPTP

If your Internet Service Provider requires the use of PPTP, enter the information below.
Note: PPTP for a WAN connection is most popular in Europe.

| | |
|-----------------------------|--|
| PPTP Account | <input type="text"/> |
| PPTP Password | <input type="password"/> |
| Please retype your password | <input type="password"/> |
| Host Name | <input type="text"/> |
| Service IP Address | <input type="text" value="0.0.0.0"/> |
| My IP Address | <input type="text" value="0.0.0.0"/> |
| My Subnet Mask | <input type="text" value="0.0.0.0"/> |
| Connection ID | <input type="text" value="0"/> (Optional) |
| MTU (1400-1460) | <input type="text" value="1460"/> |
| Maximum Idle Time | <input type="text" value="0"/> minutes <input type="checkbox"/> Auto-reconnect |

Point to Point Tunneling Protocol (PPTP) is a service that applies to connections in Europe only.

If your DSL provider says that you are connecting through PPTP, perform these steps:

- Enter the PPTP Account
- Enter the PPTP Password
- Reenter the PPTP Password
- Enter the Host Name if your ISP requires it.
- Enter Service IP Address. Your ISP will provide you with the Service IP Address.
- Enter My IP Address. This is the Router's IP address, when seen from the Internet. Your ISP will provide you with the IP Address you need to specify here.
- Enter My Subnet Mask. This is the Router's subnet mask, as seen by external users on the Internet. Your ISP will provide you with the subnet mask.
- Enter the Connection ID if your ISP requires it, or leave it blank.
- Keep the value of MTU as default setting.
Note: MTU (**M**aximum **T**ransmission **U**nit) is the largest frame size that can be transmitted over the network. Messages longer than the MTU must be divided into smaller frames.
- To change the maximum idle time, enter a new value in minutes. This determines how long the Router keeps the Internet connection active after there is no Internet activity from the LAN. Enter a value of zero means never log out.
- By checking the box next to **Auto-reconnect**, the Router will automatically connect to Internet if you are disconnected.

Important: If you enable PPTP, remember to remove any PPTP applications already installed on any of your PCs.

WAN – L2TP

| | |
|---|---|
| <input checked="" type="radio"/> Obtain an L2TP Server IP address automatically | |
| <input type="radio"/> Use the following L2TP Server IP address | <input type="text"/> . <input type="text"/> . <input type="text"/> . <input type="text"/> |
| L2TP Login User Name | <input type="text"/> |
| L2TP Login Password | <input type="text"/> |
| Please retype your password | <input type="text"/> |
| Maximum Idle Time | <input type="text"/> minutes <input type="checkbox"/> Auto-reconnect |

Enter the Login User Name, Login Password, or L2TP Server IP address required by your ISP in the appropriate fields.

Select this option when your ISP uses L2TP. Choose “Obtain an L2TP Server IP address automatically” if your ISP supports it, or choose “Use the following L2TP Server IP address” and fill in the L2TP Server IP address. Then, enter the L2TP User Name and Password assigned by your ISP. Enter a Maximum Idle Time (in minutes) to define a maximum period of time for which the Internet connection is maintained during inactivity. If the connection is inactive for longer than the defined Maximum Idle Time, then connection will be dropped. You can enable the Auto-reconnect option to automatically re-establish the connection as soon as you attempt to access the Internet again.

WAN - Static IP

| | |
|---|---|
| Static IP | |
| If your Service Provider has assigned a fixed IP address, enter the assigned IP Address, Subnet Mask and ISP Router Address provided. | |
| IP address assigned by your ISP | <input type="text"/> . <input type="text"/> . <input type="text"/> . <input type="text"/> |
| Subnet Mask | <input type="text"/> . <input type="text"/> . <input type="text"/> . <input type="text"/> |
| ISP Router Address | <input type="text"/> . <input type="text"/> . <input type="text"/> . <input type="text"/> |
| Does ISP provide more IP addresses | <input type="checkbox"/> Yes |

If you are required to use a permanent IP address to connect to the Internet, then select **Static IP Address**.

- Enter the IP address assigned by your ISP. This is the Router’s IP address, when seen from the Internet. Your ISP will provide you with the IP address you need to specify here.
- Enter Subnet Mask. This is the Router’s subnet mask, as seen by external users on the Internet. Your ISP will provide you with the subnet mask.
- Enter ISP Router Address. Your ISP will provide you with the IP address you need to specify here. This is the ISP server’s IP address.

WAN - Dynamic IP

3. WAN Settings

 **Dynamic IP Address**

Host Name

MAC Address - - - - -

If your ISP supports DHCP or you are connecting through a dynamic IP address, then select **Dynamic IP Address**.

- Enter the Host Name if your ISP requires it, or leave it blank.
- Enter the MAC Address and click **Clone MAC Address** button if your ISP requires a specific MAC address, or keep it default setting.

Important: Some ISPs may require a specific MAC address in order to establish Internet connection.

WAN - DNS

DNS

A Domain Name system (DNS) server is like an index of IP addresses and Web addresses. If you type a Web address into you browser, such as www.inexg.com, a DNS server will find that name in its index and find the matching IP address : 128.121.189.239. Most ISPs provide a DNS server for speed and convenience. Since your Service Provider many connect to the Internet with dynamic IP settings, it is likely that the DNS server IP addresses are also provided dynamically. However, if there is a DNS server that you would rather use, you need to specify the IP address below.

Domain Name Server (DNS) Address

Secondary DNS Address (optional)

If your ISP will automatically assign DNS IP addresses to the Router, keep the default setting here, then click **NEXT** button.

If your ISP does not automatically assign DNS IP addresses to the Router (e.g., when **Static IP Address** connection type is selected), enter the DNS IP address in the filed of *Primary DNS address* and *Secondary DNS address*. You need to enter at least primary DNS address.

WAN - Dynamic DNS

Dynamic DNS

Dynamic DNS provides users a method to tie up their domain names to computers or servers.

Dynamic DNS: ☒ **Enable** ☐ **Disable**

Dynamic DNS Provider:

Domain Name:

Account/E-mail:

Password/Key:

Use the Dynamic DNS screen to configure the Router to retrieve an IP address from a dynamic DNS provider. These providers allow you to associate a static hostname with a dynamic IP address. This allows you to connect to the Internet with a dynamic IP address and use applications that require a static IP address. The Router supports the following dynamic DNS providers: <http://www.dyndns.org/>, <http://www.no-ip.com/>, and <http://www.dtdns.com/>

Setting Up A Dynamic DNS Server

In order to set up a computer on your network as a dynamic DNS server, click **Enable** and specify the **Dynamic DNS Provider**, your **Domain Name**, your **Account or E-mail** address, and the **Password or Key** for your account or e-mail address.

Click **Apply** to put your changes in effect, or click **Cancel** to undo your changes.

WAN - Proxy DNS

Proxy DNS acts as a DNS Server for the Internal and DMZ networks.

Proxy DNS: ☒ **Enable** ☐ **Disable**

| Domain Name | Virtual IP Address |
|----------------------|---|
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> <input type="text" value="0"/> |

Use the Proxy DNS screen to map a domain name to its server's IP address. This feature acts as a DNS server for the internal and DMZ networks, allowing you to connect to local machines without using an

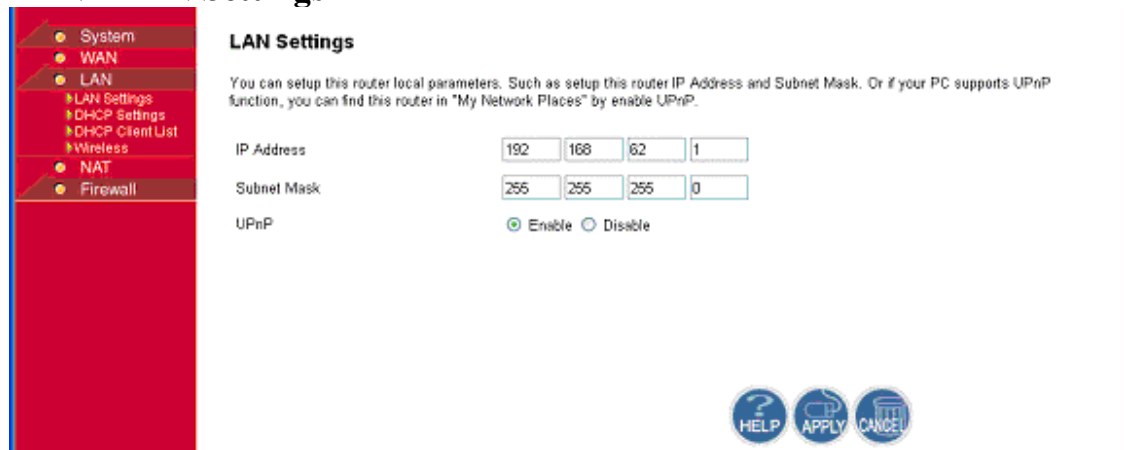

external DNS server. This simplifies network configuration and management.

Setting Up Proxy DNS Servers

In order to set up a computer on your network as a Proxy DNS Server, specify the **Domain Name** and **Virtual IP Address**.

Click **Apply** to put your changes in effect, or click **Cancel** to undo your changes.

LAN - LAN Settings

The Router is shipped pre-configured to use private IP addresses on the LAN side, and to act as a DHCP server. The Router's default LAN IP configuration is:

LAN IP address: 192.168.62.1

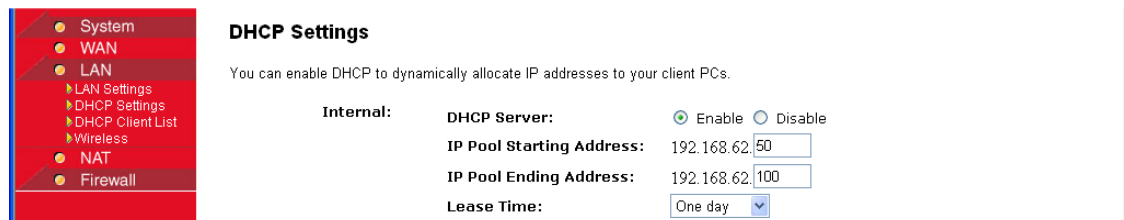

Subnet Mask: 255.255.255.0

These addresses are part of IETF-designated private address range for use in private networks, and should be suitable in most applications. If your network has a requirement to use a different IP addressing scheme, you can make those changes in this screen.

Universal Plug and Play (UPnP) helps devices, such as Internet appliances and computers, access the network and connect to other devices as needed. UPnP devices can automatically discover the services from other registered UPnP devices on the network.

The UPnP feature of the Router can be enabled or disabled for automatic device configuration. The default setting for UPnP is enabled. If disabled, the Router will not allow any device to automatically control the resources of the Router.

LAN - DHCP Setting

By default, the Router will function as a DHCP (Dynamic Host Configuration Protocol) server, allowing it to assign IP, DNS server, and default gateway addresses to all computers connected to the Router. The

assigned default gateway address is the LAN address of the Router. IP addresses will be assigned to the attached PCs from a pool of addresses specified in this screen.

LAN - DHCP Client List

DHCP Client List

The DHCP client list allows you to see which clients are connected to the DSL/Cable Gateway via IP address, host name, and MAC address.

DHCP Active IP Table for LAN

DHCP Server IP Address: 192.168.62.1

| Index | Client Host Name | IP Address | MAC Address |
|-------|------------------|------------|-------------|
| 1 | None | None | None |

DHCP Client List allows the administrator to see which clients are connected to the Router via DHCP.

NAT - Special Application

Special Application

Applications such as Internet gaming, video conferencing, and Internet telephony require multiple connections. The Special Application feature allows these applications to work properly.

Popular Applications: - select one - Copy to ID: -

| ID | Protocol | Trigger Port Range | Maximum Activity Interval | Session Chaining | Chaining on UDP | Address Replacement | Address Translation Type | Two Way Only |
|----|----------|--------------------|---------------------------|------------------|-----------------|---------------------|--------------------------|--------------|
| 1 | TCP | 0 - 0 | 50 | Enable | Enable | Enable | TCP | Enable |
| 2 | TCP | 0 - 0 | 50 | Enable | Disable | Enable | TCP | Disable |
| 3 | TCP | 0 - 0 | 50 | Enable | Enable | Enable | TCP | Enable |

Some applications require multiple connections, such as Internet gaming, video conferencing, Internet telephony and others. These applications cannot work when Network Address Translation (NAT) is enabled. If you need to run applications that require multiple connections, specify the port range normally associated with an application in the "Trigger Port Range" field, select the protocol as TCP or UDP. The following summarizes the Special Applications settings.

ID - Number designating each line item.

Protocol - Communication protocol used by the application.

Trigger Port Range - Range of ports that, when used for outgoing traffic, will trigger the gateway to accept certain incoming requests.

Maximum Activity Interval - Maximum number of milliseconds after the port trigger action during which incoming requests will be accepted.

Session Chaining - Specifies whether or not dynamic sessions can be chained, allowing multi-level session triggering.

Chaining on UDP - Specifies whether chaining should be allowed on UDP.

Address Replacement - Specifies whether or not binary address replacement should be performed.

Address Translation Type - Specifies whether address translation should be performed on TCP or UDP packets.

Two Way Only - Allows a new session to be initiated from/to the same remote host.

When you finish configuring your special applications, click "Apply" to put your changes in effect, or click "Cancel" to undo your changes

NAT - Virtual Server

Virtual Server

You can configure the DSL/Cable Gateway as a virtual server so that remote users accessing services such as the Web or FTP at your local site via public IP addresses can be automatically redirected to local servers configured with private IP addresses. In other words, depending on the requested service (TCP/UDP port numbers), the DSL/Cable Gateway redirects the external service request to the appropriate server (located at another internal IP address).

| Service | Public IP Address | Service Port | Protocol | Private IP Address |
|----------------------|--------------------------------------|--------------------------------|----------------------------------|--|
| <input type="text"/> | <input type="text" value="0.0.0.0"/> | <input type="text" value="0"/> | <input type="text" value="TCP"/> | 192.168.62. <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0.0.0.0"/> | <input type="text" value="0"/> | <input type="text" value="TCP"/> | 192.168.62. <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0.0.0.0"/> | <input type="text" value="0"/> | <input type="text" value="TCP"/> | 192.168.62. <input type="text" value="0"/> |
| <input type="text"/> | <input type="text" value="0.0.0.0"/> | <input type="text" value="0"/> | <input type="text" value="TCP"/> | 192.168.62. <input type="text" value="0"/> |

If you configure the Router as a virtual server, remote users who are accessing services such as Web or FTP at your local site via public IP addresses can be automatically redirected to local servers configured with private IP address. In other words, depending on the requested service (TCP/UDP port number), the Router redirects the external service requests to the appropriate servers.

For example:

If a local PC with a private IP address of 192.168.62.50 acts as a Web and FTP server, configure the port to forward HTTP (port 80) and FTP (port 21) to local address 192.168.62.50.

| Service | Public IP Address | Service Port | Protocol | Private IP Address |
|------------|---------------------------|--------------|----------|--------------------|
| Web Server | (Router's WAN IP address) | 80 | TCP | 192.168.62.50 |
| FTP Server | (Router's WAN IP address) | 21 | TCP | 192.168.62.50 |

In order for a remote user to access this server from the Internet, the remote user must know the Router's WAN IP address that has been assigned by your ISP. If this address is 210.61.49.227, for example, an Internet user can access this Web server by directing the browser to <http://210.61.49.227>. The Router's WAN IP address can be found in **Status** screen.

Firewall Setting

- System
- WAN
- LAN
- NAT
- Firewall
 - Client Filtering
 - URL Filtering
 - DMZ

Firewall Setting

The DSL/Cable Router provides extensive firewall protection by restricting connection parameters to limit the risk of intrusion and defending against a wide array of common hacker attacks.

☒ Enable
☐ Disable

The Router provides extensive firewall protection by restricting connection parameters to limit the risk of intrusion and defending against a wide array of common hacker attacks. Check the box next to "Disable" to disable extensive firewall protection.

Note: The default setting is Enable.

Firewall - Client Filtering

Client Filtering

You can block certain client PCs accessing the Internet based on IP address.

| | IP Filter Starting Address | IP Filter Ending Address |
|---|----------------------------|--------------------------|
| 1 | 0 . 0 . 0 . 0 | ~ 0 . 0 . 0 . 0 |
| 2 | 0 . 0 . 0 . 0 | ~ 0 . 0 . 0 . 0 |
| 3 | 0 . 0 . 0 . 0 | ~ 0 . 0 . 0 . 0 |
| 4 | 0 . 0 . 0 . 0 | ~ 0 . 0 . 0 . 0 |
| 5 | 0 . 0 . 0 . 0 | ~ 0 . 0 . 0 . 0 |

HELP APPLY CANCEL

You can filter Internet access for local clients based on IP addresses For example, 192.168.62.60 ~ 192.168.62.65.

Firewall – URL Filtering

URL Filtering

You can block client PCs accessing the Internet based on URL.

| 7 | |
| 8 | |

The feature allows you to restrict access based on web address. Up to 36 web addresses can be blocked in this feature.

Firewall - DMZ (Demilitarized Zone)

DMZ(Demilitarized Zone)

If you have a local client PC that cannot run an Internet application properly from behind the firewall, you can enable unrestricted two-way Internet access by defining a virtual DMZ Host.

| Public IP Address | Private IP Address |
|-------------------|--------------------|
| 0.0.0.0 | 192.168.62.0 |
| 0.0.0.0 | 192.168.62.0 |
| 0.0.0.0 | 192.168.62.0 |
| 0.0.0.0 | 192.168.62.0 |
| 0.0.0.0 | 192.168.62.0 |
| 0.0.0.0 | 192.168.62.0 |
| 0.0.0.0 | 192.168.62.0 |
| 0.0.0.0 | 192.168.62.0 |

The DMZ hosting feature allows local PCs to be exposed to the Internet for use of a special-purpose service such as Internet gaming or videoconferencing. DMZ hosting forwards all the ports at the same time to the local PC. The Virtual Server or Special Application feature is more secure because it only opens the ports you want to have opened, while DMZ hosting opens all the ports of local computer, exposing the computer so the Internet can see it.

To enable DMZ hosting, select the public IP address (which is Router’s WAN IP address) and enter the IP address of local computer used for DMZ host.

Appendix A: Troubleshooting

This section describes common problems you may encounter during setup of the Router. If you cannot resolve any connection problems after checking the following solutions, please contact our tech support.

Troubleshooting

Power Adapter

- Check connections between Router and external power supply, or the wall outlet
- If the power indicator does not turn on when the power outlet, power cord, or external power supply
- If unit powers off after running for a period of time, check for loose power connections, power losses or surges at the power outlet.
- If problem still persistent please contact our technical support for assistance.

Router LED

- Verify that the router and the device attached is on
- Make sure the cable is seated properly and that the correct cable type is used
- Make sure that the NIC is configure for the proper communication speed
- Check the adapter on the attached device and cable connections for possible defects.

Network Connection

- Verify that the IP address is properly configured. Use the router's DHCP function to dynamically assign IP addresses to any PCs on the attached LAN. Please verify that you're on the same sub-network if you manually configure your IP.

Management Problems

- Make sure that you have configured the router with a valid IP address, subnet mask and default Router.
- Check that you have a valid network connection to the Router by pinging the Router's IP.
- Check the network cabling between the management station and the Router

Appendix B: Specifications

| | |
|------------------------------|---|
| Standards: | IEEE 802.3 10BASE-T, IEEE 802.3u 100 BASE-TX, IEEE 802.3x flow control IEEE 802.11b Wireless LAN |
| Ports: | LAN: Four 10/100Mbps RJ-45 Auto-MDI/MDIX switch ports WAN: One 10/100Mbps RJ-45 Auto-MDI/MDIX port for DSL/Cable modem |
| Wireless Frequency band: | 2.400 - 2.497 GHz |
| Radio frequency technique: | Direct Sequence Spread Spectrum (DSSS) |
| Wireless data rate: | Dynamic rate scaling at 11/5.5/2/1 Mbps |
| Wireless operating channels: | 1–11 US/Canada, 1–13 Europe (ETSI), 10–13 France, 10–11 Spain, 1–13 or 14 th Japan |
| Wireless operating range: | Open environment: 150 – 300 meter (492-984 feet) Indoor environment: 30 – 100 meter (98-328 feet) |
| RF max. output power: | +18dBm |
| Receiver sensitivity: | Typical –85dBm @ 11 Mbps |
| Antenna: | One dipole antenna |
| Antenna gain: | > 1.4 dBi |
| Antenna max. power rating: | 2W |
| Antenna directional: | Omni |
| Platforms supported: | PC or Apple Mac |
| Protocols supported: | TCP/ IP, NAT, UDP, PPPoE, PPTP, DHCP (client and server), HTTP, TFTP, CSMA/CD for wire, CSMA/CA for wireless, NAT/PAT |
| WAN type supported: | static IP address, dynamic IP address (DHCP), PPPoE client, PPTP, and L2TP |
| Max. users supported: | 253 |
| Management: | Embedded Web server for browser management Wireless Access Control Firmware upgrade via HTTP DHCP (server and client) in LAN for IP assignment Even Log text file Universal Plug and Play Restore to factory default setting |
| Security: | Natural firewall, NAT, private IP addresses not accessible from Internet IP Packet filtering (IP address/Port number) MAC address filtering 64-bit/128-bit WEP encryption |
| VPN: | L2TP pass through PPTP pass through IPSec pass through |
| Operating temperature: | 0-55°C |
| Compliance: | CE, FCC Part 15, C-tick |
